

POLYKRAFT MOISTURE BARRIER

Polykraft Moisture Barrier (PKMB) is an engineered multilayer composite film used as a moisture retarder on metal jacketing consisting of at least one layer of minimum 40 LB Kraft paper and one layer of plastic film, usually polyethylene at a minimum thickness of 1 mil.

PKMB is heat laminated in the factory to the interior surface of all types of metal jacketing for mechanical insulation to help prevent pitting, crevice, and galvanic corrosion of the interior surface of the metal jacketing and the underlying insulated pipe, tank, or equipment.
